model, which is a commonly used LBM, is given by
$$f_i(x+e_i\tau, t+\tau) - f_i(x, t) = -\tau (f_i(x, t) - f_{ieq}(x, t)),$$
 where $f_i(x, t)$ and $f_{ieq}(x, t)$ are the particle and equilibrium distribution functions at (x, t) , e_i is the particle velocity along the i th direction and τ is the single-relaxation-time parameter that controls the rate of approach to equilibrium.

Application of lattice Boltzmann method for incompressible ...

Lattice Boltzmann methods, originated from the lattice gas automata method, is a class of computational fluid dynamics methods for fluid simulation. Instead of solving the Navier–Stokes equations directly, a fluid density on a lattice is simulated with streaming and collision processes. The method is versatile as the model fluid can straightforwardly be made to mimic

In this work, the lattice Boltzmann method, a particle-based approach, is applied to simulate the two-dimensional isothermal pressure driven microchannel flow. Two boundary treatment schemes are incorporated to investigate their impacts to the entire flow field.

Application of Lattice Boltzmann Method for fluid flow ...

The lattice Boltzmann method (LBM) has developed rapidly in the past years especially in the simulation of multiphase flows. As a powerful and innovative tool of computational fluid dynamics (CFD), LBM enjoys the advantage of natural parallelism, flexible geometry characteristics, simplicity of implementation and high precision.

A lattice Boltzmann method (LBM) is used to solve the energy equation in a test problem involving thermal radiation and to thus investigate the suitability of scalar diffusion LBM for a new class of problems. The problem chosen is transient conductive and radiative heat transfer in a 2-D rectangular enclosure filled with an optically absorbing, emitting and scattering medium.
