Elliptic Curves and Arithmetic Invariants. Contains top-notch research that will interest both experts and advanced graduate students. Written by an expert renowned for his discovery that modular forms fall into families, otherwise known as "Hida families". Limits material to elliptic modular curves and the corresponding Shimura curves in order to make the book more accessible to graduate students .

In mathematics, an elliptic curve is a smooth, projective, algebraic curve of genus one, on which there is a specified point O. Every elliptic curve over a field of characteristic different from 2 and 3 can be described as a plane algebraic curve given by an equation of the form y 2 = x 3 + a x + b. {\displaystyle y^{2}=x^{3}+ax+b.} The curve is required to be non-singular, which means that the curve has no cusps or self-intersections. It is always understood that the curve is really sitting in

The j-invariant for the elliptic curve may now be defined as j = c 4 3 ? {\displaystyle j={\frac {c_{4}^{3}}{\Delta }}} In the case that the field over which the curve is defined has characteristic different from 2 or 3, this is equal to

I'd very much appreciate a clear statement of what transformations are the invariants actually invariant to, and if there are more general "invariants" if all I care about is whether two curves have solutions I can match up to each other.
